

**System and Method for Biometric
Identification and Response**

ABSTRACT

A system and method for biometric identification and
5 response is presented. Raw biometric data is received by a
biometric acquisition system. The biometric acquisition
system generates a digital signature based on the raw
biometric data. The digital signature is compared to a
10 biometric action data list to find a match. If a match is
found, a message is sent to one or more recipients based on
who the identified person is. The message can be
customized and include a current photo of the identified
person and the location as to where the identified person
15 is spotted. The message may be encrypted and also include
a digital signature of the sender in order for the
recipient to verify the sender of the message.
